DETAILED ACTION

Response to Arguments

Applicant's arguments, filed 1/17/08, with respect to claims 1-14 have been fully considered and are persuasive. The 35 U.S.C. 112, second paragraph rejection of claims 1-14 has been withdrawn.

Allowable Subject Matter

Claims 1-14 and 18 are allowed.

The following is a statement of reasons for the indication of allowable subject matter:

Regarding claim 1, the prior art does not contain a combination of references that specifically teaches a method of producing color compensation transforms comprising the steps of: using a calibrated scanner to scan at least a first color reference patch and a second color reference patch to produce a corresponding first and second scanned color space values, respectively, wherein the first and second color reference patches thereof exhibit respective first and second material compositions that are sufficiently different, one from the other, as to prevent a scanner, calibrated to the first material composition, from producing scanned color space values of as high a degree of accuracy with respect to scannable objects exhibiting at least the second material composition; and combining said first and second plurality of scanned color space values with at least the first and second of measured color space values to create a compensation table, the first and second measured color space values plurality thereof

being a result of the first and second color reference patches thereof having been measured with an optical measuring device; wherein said compensation table is selectively useable as part of said compensation transforms to enable a scanner to produce scanned color space values of substantially as high a degree of accuracy with respect to a scannable object exhibiting said first material composition as with respect to a scannable object exhibiting said second material composition.

Claims 2-14 are allowed because they depend upon an allowed base claim.

Regarding claim 18, the prior art does not specifically teach compensation transforms for CMYK inks are processed for different levels of K using the formula $y = af_{\text{sub}.0}(x) + (1-a)f_{\text{sub}.1}(x)$, wherein y is the compensated output, x is the uncompensated output, $f_{\text{sub}.0}(x)$ is a transform for a first K cube, $f_{\text{sub}.1}(x)$ is a transform for a second K cube, and a is a scaling factor.
